### **DETAILED ACTION**

1. The amendment filed March 3, 2006 is entered and claims 12, 13, 15, 17-20, 29, and 31-33 are pending.

#### ***Allowable Subject Matter***

2. Claims 12, 13, 15, 17-20, 29, and 31-33 are allowed.
3. The following is an examiner's statement of reasons for allowance: the claimed invention is directed to an apparatus for processing a video signal.

Independent claim 12 identifies a uniquely distinct feature "a generator to generate a plurality of dither coefficient signals, each coefficient signal carrying dither coefficients arranged in a matrix. weighting being applied to each dither coefficient for components of the input video signal. the components having gradation levels equal to or lower than a predetermined level, the gradation levels being divided into low to high gradation groups in the order of level of the gradation, in which the weighting to be applied is constant in each gradation group whereas larger for lower gradation groups".

Independent claim 13 identifies a uniquely distinct feature "a generator to generate a plurality of first dither coefficients pattern signals each being selected from a plurality of predetermined dither coefficients pattern signals in accordance with the detected color gradation level of each dot data of the (n x m) matrix pattern, each generated first dither coefficients pattern signal carrying dither coefficients arranged in the (n x m) matrix pattern, weighting being applied to each dither coefficient for

components of the input video signal, the components having gradation levels equal to or lower than a predetermined level, the gradation levels being divided into low to high gradation groups in the order of level of the gradation, in which the weighting to be applied is constant in each gradation group whereas larger for lower gradation groups”.

Independent claim 29 identifies a uniquely distinct feature “generating a plurality of first dither coefficients pattern signals each being selected from a plurality of predetermined dither coefficients pattern signals in accordance with the detected color gradation level of each dot data of the (n x m) matrix pattern, each generated first dither coefficients pattern signal carrying dither coefficients arranged in the (n x m) matrix pattern, weighting being applied to each dither coefficient for components of the input video signal, the components having gradation levels equal to or lower than a predetermined level, the gradation levels being divided into low to high gradation groups in the order of level of the gradation, in which the weighting to be applied is constant in each gradation group whereas larger for lower gradation groups”.

The closest art, Shigeta as discussed in the previous Office action, either singularly or in combination, fails to anticipate or render obvious the above limitations obvious.

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
